Individual Project

(Statistical Methods II, 2nd Semester, 2025-26)

- You will collect your own data from any suitable source (books, journals, newspapers, internet, …). You may also do your own experiment or survey to collect data, although that will take time and I do not recommend it.
- The data should be such that the results of its analysis should be of contemporary interest.

Use some (or all if that is warranted) of the statistical techniques that you have learned in your B. Stat curriculum up to this point to analyze the data that you have collected.

The analysis of the data should, typically, contain a descriptive or exploratory part (in the form of graphs, tables, …), and an analytical or methodological part.

Present the analysis systematically. Clearly mention the source of the data, and explain why the results of your analysis would be of interest to the policy planners in the present day scenario.

This is worth 20% of your final semester grade, so it should be a substantial work, and not just a minor data analysis.

Preparation of the Report

The report should be in a single pdf file. The main content should not exceed 10 double spaced pages with regular margins. There can be an additional title page which should also contain an abstract. Figures and references can be added separately beyond these 10 pages.

I emphasize again that data source must be clearly mentioned in the report – through a book or journal reference, through the specification of an URL, or any other appropriate manner. If necessary, and if it is a small dataset, it may also be attached at the end of the report, and this will not be counted towards the 10 pages of the content of the report.

The (strict) deadline for submission is 11.59 pm, Tuesday, 21 April. The report must be submitted online to the TA. I will share his email address later on.
